SOLVING INTEGER LINEAR PROGRAMMING (ILP) PROBLEM

B: CUTTING-PLANE METHOD

NOTE:
Solving ILP model is much much harder than LP model.
Research continues to solve ILP model efficiently but still, solving ILP is a big big issue.
LP = No issue in solving
ILP = Big issue

Example:

$$\text{Max } Z = 5x_1 + 8x_2$$
$$x_1 + 2x_2 \le 8$$
$$4x_1 + x_2 \le 10$$
$$x_1, x_2 \ge 0 \text{ and Integers}$$

Step I: Relax the integer requirement and solve the resulting relaxed model using Simplex Method.

$$\text{Max } Z = 5x_1 + 8x_2$$
$$x_1 + 2x_2 \le 8$$
$$4x_1 + x_2 \le 10$$
$$x_1, x_2 \ge 0 \quad \text{(Contineous Variables) (Relaxed)}$$

STANDARD FORM

$$\text{Max } Z = 5x_1 + 8x_2$$
$$x_1 + 2x_2 + s_1 = 8$$
$$4x_1 + x_2 + s_2 = 10$$
$$x_1, x_2 \ge 0$$

	C_j	5	8	0	0		
C_B	Basic	x_1	x_2	s_1	s_2	Sol	Ratio
0	S_1	1	2	1	0	8	$8/2 = 4$ ←
0	S_2	4	1	0	1	10	$10/1 = 10$
	Z_j	0	0	0	0	0	
	$C_j - Z_j$	5	8 ↑	0	0		
8	x_2	$1/2$	1	$1/2$	0	4	$4 * 2/1 = 8$
0	S_2	$7/2$	0	$-1/2$	1	6	$6 * 2/7 = 12/7$ ←
	Z_j	4	8	4	0	32	
	$C_j - Z_j$	1 ↑	0	-4	0		
8	x_2	0	1	$4/7$	$-1/7$	$22/7$	
5	x_1	1	0	$-1/7$	$2/7$	$12/7$	
	Z_j	5	8	$27/7$	$2/7$	$236/7$	
		0	0	$-27/7$	$-2/7$		

$(4\ \ 1\ \ 0\ \ 1\ \ 10) -$
$1(1/2\ \ 1\ \ 1/2\ \ 0\ \ 4)$
$= (7/2\ \ 0\ \ -1/2\ \ 1\ \ 6)$

$(1/2\ \ 1\ \ 1/2\ \ 0\ \ 4) -$
$1/2(1\ \ 0\ \ -1/7\ \ 2/7\ \ 12/7)$

$(1/2\ \ 1\ \ 1/2\ \ 0\ \ 4) -$
$(1/2\ \ 0\ \ -1/14\ \ 1/7\ \ 6/7)$
$= (0\ \ 1\ \ 4/7\ \ -1/7\ \ 22/7)$

Solution: optimal
Solution: non-integer
Non-integer Solution

Step II:

STEP II: If all basic variables have integer Solution, STOP. this is your optimum Solution. If not

STEP III : For each basic variable with non-integer solution in the optimum iteration, find the fraction part f_i using

$$b_i = [b_i] + f_i \qquad \text{where } [b_i] = \text{integer part}, \quad f_i = \text{fractional part}$$

optimum iteration:

C_B	Basic	x_1	x_2	S_1	S_2	Sol
8	x_2	0	1	$4/7$	$-1/7$	$\frac{22}{7}$
5	x_1	1	0	$-1/7$	$2/7$	$12/7$

Basic	b_i Sol	$[b_i]$	f_i
x_1	$\frac{12}{7}$	1 +	$\frac{5}{7}$
x_2	$\frac{22}{7}$	3 +	$\frac{1}{7}$

STEP IV : Choose the largest fraction among various f_i (i.e $Max(f_i) = 5/7$).

~~treat~~
Treat the Constraint Corresponding to the maximum fraction (i.e., x_1-row) as the source row (equation)

Based on the source equation, develop an additional contraint (Gomory's Constraint / fractional cut) as shown:

$$-f_i = S_i - \Sigma\left((f_i)(\text{Non-Basic Var.})\right)$$

Here Largest fraction = $5/7$ (Corresponding Constraint is x_1)

Source row

$$12/7 = x_1 + 0 \overbrace{- 1/7\, S_1 + 2/7\, S_2}^{\text{Non-Basic}}$$

$$1 + \frac{5}{7} = x_1 + (-1 + 6/7)\, S_1 + (0 + \frac{2}{7})\, S_2$$

f_i associated with x_1 — f_i associated with S_1 — f_i associated with S_2

The Corresponding fractional Cut:

$$-f_i = S_i - \Sigma\left((f_i)(\text{Non-Basic Var.})\right)$$

$$-5/7 = S_3 - 6/7\, S_1 - 2/7\, S_2$$

STEP V : Add the fractional Cut as the last row in the latest optimal iteration and proceed further using dual simplex method, and find the new optimum. If new optimum solution is integer then STOP, if not, go to step III.

C_B	Basic	x_1 (5)	x_2 (8)	S_1 (0)	S_2 (0)	S_3 (0)	Sol
8	x_2	0	1	$4/7$	$-1/7$	0	$\frac{22}{7}$
5	x_1	1	0	$-1/7$	$2/7$	0 $\cancel{2/7}$	$12/7$
0	S_3	0	0	$-6/7$ ✓	$-2/7$	1	$-5/7$ ←
	z_j	5	8	$27/7$	$2/7$	0	$236/7$
	$c_j - z_j$	0	0	$-27/7$ ✓	$-2/7$ ↑	0	
($c_j - z_j$ / Pivot row)	Ratio	–	–	$9/2$	min ratio 1	0	
8	x_2	0	1	1	0	$-1/2$	$7/2$
5	x_1	1	0	-1	0	1	1
0	S_2	0	0	3	1	$-7/2$	$5/2$
	z_j	5	8	3	0	1	33
	$c_j - z_j$	0	0	-3	0	-1	

optimum = YES
feasible = No

apply Dual Simplex Method to obtain feasible solution

$\boxed{x_2:}$
$(0\ 1\ 4/7\ -1/7\ 0\ \frac{22}{7}) - -1/7(0\ 0\ 3\ 1\ -7/2\ 5/2)$

$\boxed{x_1:}$
$(1\ 0\ -1/7\ 2/7\ 0\ 12/7) - 2/7(0\ 0\ 3\ 1\ -7/2\ 5/2)$

- optimal
- feasible but
- non-integer

STEP III :

$$b_i = [b_i] + f_i$$

		$[b_i] + f_i$
x_2	$7/2$	$3 + 1/2$
S_2	$5/2$	$2 + 1/2$

max $(1/2, 1/2) = 1/2$ (tie)
preference will be given to decision variable x_2.

Treat Constraint related to x_2 as the Source raw :

$$7/2 = 0 + x_2 + S_1 \overbrace{+0 - 1/2\, S_3}^{\text{Non-Basic}} \Rightarrow 3 + \tfrac{1}{2} = x_2 + S_1 + \underbrace{(-1 + 1/2)}_{} \overset{\text{non Basic}}{S_3}$$

Develope additional Constraint as shown :

$$-f_i = S_i - \Sigma\,((f_i)(\text{Non-Basic Var.}))$$

$$-1/2 = S_4 - 1/2\, S_3$$

STEP IV : Add this fraction Cut as the last row in the Latest optimal iteration and find new optimum using dual Simplex.
